polylinker; 1st strand cDNA was prepared from pooled bulk
breast tumor tissue, and was then primed with a Not I -
oligo(dT) primer. Double-stranded cDNA was ligated to Eco
RI adaptors (Pharmacia), digested with Not I and cloned
into the Not I and Eco RI sites of the modified p7T3
vector. This library is the normalized version of
NCI_CGAP_Br1.1. Library was constructed by Bento Soares
and M. Fatima Bonaldo."

                                                                                                                                                                                                                       DNA encoding human vascular endothelial growth factor 3 - useful to develop prods. for, e.g. stimulating anglogenesis or treating tumours, inflammation or rheumatoid arthritis Claim 1; Page 43; 56pp; English.

This sequence encodes human vascular endothelial growth factor 3 (YEGF3). The growth factor can be used to stimulate angiogenesis and wound healing, and to promote vascular tissue repair. It can also be used to induce the growth of damaged bone, periodontium or ligament tissue. VEGF3 antagonists can be used to inhibit tumour growth, or to receive the diabetic retinopathy, inflammation, rheumatoid arthritis or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                01-SEP-1997 (first entry)

PT Vascular endothelial growth factor VEGF-B proteins - useful to reclarate andiogenesis in wound healing, also related nucleic acid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         PT accelerate anglogenesis in wound healing, also related nucleic acid
PT and antibodies for cancer diagnosis
Claim 1: Page 61-62: 107pp; English.
CC 37909-T37915 represent the coding sequences for the vascular endothelial
CC growth factor (VEGF) proteins of the invention, which promote endothelial
CC dimer, and is sometimes referred to as vascular permeability factor
CC (VPF). VEGF has diverse effects, depending on the specific biological
CC context in which it is found. VEGF is a potent endothelial cell mitogen,
CC and directly contributes to induction of anglogenesis in vivo by
CC promoting endothelial cell growth during normal embryonic development,
CC wound healing, and tissue regeneration/reorganisation. The VEGF proteins
CC of the invention share the angiogenic and other properties of VEGF, but
CC are distributed and expressed in tissues differently to VEGF but
CC angiogenesis. The antibodies can also be used for inhibiting
CC angiogenesis. The antibodies can also be used diagnostically to
CC guantitatively detect VEGF-B. Primers complementary to the coding
CC sequences for the proteins of the invention can also be used to detect
CC VEGF-B coding sequences. Quantification of VEGF-B in cancer biopsy
CC specimens may be useful as an indicator of metastatic risk. VEGF-B
CC expression in a cell can be retarded using antisense sequences direct

WRF186 cDNA (T13809) codes for the murine homologue (W00863) of human vascular endothelial growth factor-like polypeptide SOM175 (W00725), a protein capable of inducing astroglial proliferation and of promoting neural survival and/or proliferation. It was obtd. from a new-born mouse brain cDNA library using SOM175 cDNA (see also T33610) as probe. The murine VRF gene maps near to the centromere of chromosome 19. It is highly expressed in embryo tis and in the heart and brown fat of adult mice. An alternatively spliced variant, VRF169 (T13810), was also identified.

Vascular endothelial growth factor VEGF-B proteins - useful to accelerate angiogenesis in wound healing, also related nucleic acid and antibodies for cancer diagnosis Claim 1; Page 60; 107pp; English. 737909-T37915 represent the coding sequences for the vascular endothelial growth factor (VEGF) proteins of the invention, which promote endothelial or mesodermal cell proliferation. VEGF is also a glycosylated cationic dimer, and is sometimes referred to as vascular permeability factor
                                                                                                                                                                                                                                                                                                                                                                                                                28-APR-1997 (first entry)
VEGF-8186 coding sequence.

CC (VPF). VEGF has diverse effects, depending on the specific Diological CC context in which it is found. VEGF is a potent endothelial cell mitogen, CC and directly contributes to induction of angiogenesis in vivo by CC promoting endothelial cell growth during normal embryonic development, CC wound healing, and tissue regeneration/reorganisation. The VEGF proteins CC of the invention share the angiogenic and other properties of VEGF, but CC are distributed and expressed in tissues differently to VEGF. The CC proteins can therefore be used to accelerate angiogenesis in wound CC healing. Antibodies against the proteins can be used for inhibiting CC quantitatively detect VEGF. B. Primers complementary to the coding sequences for the proteins of the invention can also be used to detect VEGF B. Coding sequences. Quantification of VEGF B in cancer blopsy CC specimens may be useful as an indicator of metastatic risk. VEGF-B CC expression in a cell can be retarded using antisense sequences direct CC VEGF expression in tumour cells.

PS Claim 1; Page 58-59; 107pp; English.

CC 37309-737915 represent the coding sequences for the vascular endothelial
CC or mesodermal cell proliferation. VEGF is also a glycosylated cattonic
CC dimer, and is sometimes referred to as vascular permeability factor
CC (VPF). VEGF has diverse effects, depending on the specific biological
CC context in which it is found. VEGF is a potent endothelial cell mitogen,
CC and directly contributes to induction of anylogenesis in vivo by
CC promoting endothelial cell growth during normal embryonic development,
CC wound healing, and tissue regeneration/reorganisation. The VEGF proteins
CC of the invention share the anylogenic and other properties of VEGF, but
CC are distributed and expressed in tissues differently to VEGF. The
CC proteins can therefore be used to accelerate anylogenesis in wound
CC anylogenesis. The antibodies can also be used diagnostically to
CC angulation any detect VEGF-B. Primers complementary to the coding
CC sequences for the proteins of the invention can also be used to detect
CC VEGF B coding sequences. Quantification of VEGF-B in cancer biopsy
CC expression in a cell can be retarded using antisense sequences direct

3 cDNA clones (T33611-13) code for splice variants (W00726-28) of the human vascular endothelial growth factor-like polypeptide SOM175 (see also W00725). They were identified in a human foetal spleen library and respectively lack exon 6, exons 6+7, and exon of the SOM175 gene (see also T33610). The CNNA clones can be used to produce recombinant SOM175 proteins that are useful for inducing astroglial proliferation and for promoting neural surviving and/or proliferation.

CDNA clones (T33611-13) code for splice variants (W00726-28) of the human vascular endothelial growth factor-like polypeptide SOM175 (see also W00725). They were identified in a human foetal spleen library and respectively lack exon 6, exons 6+7, and exon 4 of the SOM175 gene (see also T33610). The CDNA clones can be used to produce recombinant SOM175 proteins that are useful for inducing astroglial proliferation and for promoting neural survive sequence 993 np.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Example 3; Page 47-48; 113pp; English.

3 cDNA clones (T33611-13) code for splice variants (W00726-28) of the human vascular endothelial growth factor-like polypeptide SOM175 (see also W00725). They were identified in a human foetal spleen library and respectively lack exon 6, exons 6+7, and exon of the SOM175 gene (see also T33610). The CDNA clones can be used to produce recombinant SOM175 proteins that are useful for inducing astroglial proliferation and for promoting neural surviv and/or proliferation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Grimmond S, Haywa Weber G; WPI; 96-412774/41.

PT accelerate anylogenesis in wound healing, also related nucleic acid process and antibodies for cancer diagnosis

Sclaim 1; Page 54-55; 107pp; English.

CC 373909-T37915 represent the coding sequences for the vascular endothelial cristoper context in which proteins of the invention, which promote endothelial connessodermal cell proliferation. VEGF is also a glycosylated cattonic context in which it is found. VEGF is also a glycosylated cattonic context in which it is found. VEGF is a special endothelial context in which it is found. VEGF is a potent endothelial context in which it is found. VEGF is a potent endothelial context in which it is found. VEGF is a potent endothelial in the promoting endothelial cell growth during normal embryonic development, contributes to induction of anylogenesis in vivo by context in which hall cell growth during normal embryonic development, contributed and expressed in tissues differently to VEGF but are distributed and expressed in tissues differently to VEGF. The categories can therefore be used to accelerate anylogenesis in wound consider the proteins can be used disponsition; anylogenesis. The antibodies can also be used disponsition; the vegf coding sequences. Outsitication of VEGF in cancer blopsy consist the VEGF coding sequences. Outsitication of VEGF in cancer blopsy consist the VEGF coding sequences, outsitication of vegf-b in cancer blopsy consist the VEGF coding sequences, outsitication of metastatic risk. VEGF-B coding antibodies can also be used in cancer blopsy consist the VEGF coding sequences, outsitication of metastatic risk. VEGF-B coding sequences of the sing antisense sequences direct vegf-b coding antisense sequences direct vegf-b coding antisense sequences direct vegf-b coding antisense sequences direct coding sequences. Outsitication of vegf-b coding in transfer direct vegf-b coding antisense sequences direct vegf-b coding antisense sequences direct coding sequences. Outsit is sepecially useful in retarding vegf-b coding code code code code code code c

VRR169 cDNA (T13810) codes for a murine homologue (W00864) of an alternatively spliced variant (W00765) of human vascular endothelial growth factor-like polypeptide SOW175 (see also W00725), a protein capable of inducing astroglial proliferation and of promoting neural survival and/or proliferation. It was obtd. from a new-born mouse brain cDNA library using SOM175 cDNA (see also T33610) as probe. The murine VRF gene maps near to the centromere of chromosome 19. It is highly expressed in embryo tissue and in the heart and brown fat of adult mice. VRF169 lacks exon 6, found in VRF186 cDNA (T13809).

CC T37909-T37915 represent the coding sequences for the vascular endothelial CC prowth factor (VEGF) proteins of the invention, which promote endothelial CC or mesodermal cell proliferation. VEGF is also a glycosylated cationic dimer, and is sometimes referred to as vascular permeability factor CC (VPF). VEGF has diverse effects, depending on the specific biological context in which it is found. VEGF is a potent endothelial cell mitogen, and directly contributes to induction of angiogenesis in vivo by CC promoting endothelial cell growth during normal embryonic development, wound healing, and tissue regeneration/reorganisation. The VEGF proteins cof the invention share the angiogenic and other properties of VEGF, but CC are distributed and expressed in tissues differently to VEGF. The proteins can therefore be used to accelerate angiogenesis in whound complements can therefore be used to accelerate angiogenesis in wound complements. The antibodies can also be used diagnostically to VEGF-B coding sequences. Quantification of VEGF-B in cancer biopsy specimens may be useful as an indicator of metastatic risk. VEGF-B cognish the VEGF coding sequences, this is especially useful in retarding vegenession in a cell can be retarded using antisense sequences direct complements.

Claim 1; Page 53; 107pp; English.

CC thim 1; Page 53; 107pp; English.

CC this represents a fragment of the mouse embryo vascular endothelial control of the five the factor. B (VEGF-B) protein coding sequence. The encoded proteins of the invention, and coding sequence. The encoded proteins of the invention, and coding sequence. The encoded proteins of the invention on the coding sequence of the invention share code of coding sequence of the invention share code of coding sequence of the coding sequence of complementary to the coding sequences of the proteins of the invention of coding sequences for the proteins of the invention of coding sequences of coding sequences. Quantification of coding sequences of the proteins of the invention of coding sequences of the proteins of the invention of coding sequences of the proteins of the invention of coding sequences for the proteins of the invention of coding sequences of coding sequences. Quantification of coding sequences of coding sequences of coding sequences of coding sequences.

VEGF-B expression in a cell can be retarded using antisense sequences direct against the VEGF coding sequences, this is especially useful in retarding VEGF expression in tumour cells. PS Claim 1; Page 56; 107pp; English.

CC 137909-T37915 represent the coding sequences for the vascular endothelial cor mesodermal cell proliferation. VEGF is also a glycosylated cationic dimer, and is sometimes referred to as vascular permeability factor (VPF). VEGF has diverse effects, depending on the specific biological context in which it is found. VEGF is a potent endothelial cell mitogen, and directly contributes to induction of anglogenesis in vivo by commoting endothelial cell growth during normal embryonic development, wound healing, and tissue regeneration/reorganisation. The VEGF proteins of the invention share the angiogenic and other properties of VEGF, but care distributed and expressed in tissues differently to VEGF. The proteins can therefore be used to accelerate angiogenesis in wound healing. Antibodies against the proteins can be used for inhibiting cances for the proteins can also be used diagnostically to vegF. The antibodies against the proteins can be used for inhibiting cances for the proteins can also be used for inhibiting cances for the proteins can also be used for inhibiting cances for the proteins can also be used for inhibiting cances for the proteins can also be used for inhibiting cances for the proteins can also be used for inhibiting cances for the proteins can also be used for inhibiting cances for the proteins can also be used for inhibiting cances for the proteins can also be used for inhibiting cances for the proteins can also be used for inhibiting cances for the proteins can also be used for inhibiting cances for the proteins can also be used for inhibiting cances for the proteins can also be used for inhibiting cances for the proteins can also be used for inhibiting cances for the proteins can also be used for inhibiting cancer because the proteins can also be used for inhibiting cancer because the proteins can also be used for inhibiting cancer because the pr

PS Disclosure; Fig 7(1-2); 94pp; English.

CF Fetal human vascular smooth muscle cells mRNA was isolated

CF for the preparation of a cDNA library.

CT the two forms of VEFG (Q10797 and Q10917) which arise through

different message splicing, have different properties. In partic.

CHPGF121 does not bind to heparin leaving more of the protein free to

Dind to VEGF receptor and increase the half-life and distribution of

CT the protein in circulation, whereas hBEGF165 binds heparin strongly.

The product can be used for angiogenesis and re-endothelialisation

Of inner vascular surfaces in wound healing, e.g. treatment of full-

thickness wounds such as dermal ulcers, venous ulcers and diabetic

ulcers, burns, in surgery, in balloon angioplasty and for the in

vitro culturing of endothelial cells. Hybrid growth factors of pDGF

and VEGF can exhibit a mitogenic profile between each factor and

can be used for wound healing or as inhibitors of angiogenesis for

e.g. preventing the growth of tumours.

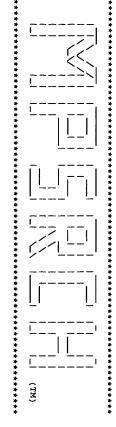

VEGF analogues in which CYS residues are substd. are more stable.

Statistics: Mean 10.510; Variance 5.631; scale 1.866

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed and is derived by analysis of the total score distribution.
